

TX1 — ligature at a real word boundary

Each target ends in a word whose final glyph is one ligature character followed by a genuine space. A rewrite that eats the space along with the ligature closes that gap.

The schedule raises the marginal tariff [[TX1A]] on every tranche.

We apply a tariff on imported staff [[TX1B]] costs.

A control: the fixed offer [[TX1C]] is settled first.

TX2 — adjacent lines, tight leading

Four lines eight points apart, so each line's glyphs reach into its neighbours'. Only the middle two are annotated.

the line above the target, which must never be captured [[TX2X]]
the target line itself, selected on its own [[TX2A]]
the line below the target, also selected on its own [[TX2B]]
the line below that, which must never be captured [[TX2Y]]

TX3 — quad edges inside a word

Each selection stops or starts mid-word, so the quad edge falls between two glyphs of one word and, in most producers, of one text-showing operator.

[[TX3A]] a persistent leverage premium on the residual variance

the marginal contribution [[TX3B]] to total active risk

TX3C is the exception: its edge falls inside one glyph, stopping between the halves of a two-f ligature, which is one indivisible glyph.

[[TX3C]] the annual payoff schedule for the year

TX4 — hyphenated line breaks

One break falls inside a word, the other on a compound hyphen that belongs to the text. Nothing in the PDF tells them apart.

the surrounding infra-

structure of the market [[TX4A]]

a memory-

mapped representation of the file [[TX4B]]

TX5 — non-ASCII in the covered text

Accents, dashes and quotation marks in the DOCUMENT, decoded through the font's /ToUnicode – a separate path from the comment decoding in tests/comments, sharing none of its code.

the Größe of a café — naïve, précis, Ångström [[TX5A]]

the “efficient” frontier's edge – a co-operative fixed point [[TX5B]]
